1. Antisymmetry of the Generator, Q24.1

Show that θ_{ij} in eq. (24.4) must be antisymmetric if R is orthogonal.

Solution. Consider an infinitesimal transformation of $SO(N)$,

$$R_{ij} = \delta_{ij} + \theta_{ij}. \quad (1.1)$$

By property of $SO(N)$, we have

$$R_{ij}R_{ik} = \delta_{jk} \implies (\delta_{ij} + \theta_{ij})(\delta_{ik} + \theta_{ik}) = \delta_{jk} + \theta_{jk} + \theta_{kj} = \delta_{jk} \implies \theta_{jk} = -\theta_{kj}. \quad (1.2)$$

□

2. Structure Constants from $SO(N)$ Transformations, Q24.2

By considering the $SO(N)$ transformation $R'^{-1}R^{-1}R'R$, where R and R' are independent infinitesimal $SO(N)$ transformations, prove eq. (24.7).

Solution. Now, we write the $\theta_{ij} = -i\theta^a(T^a)_{ij}$, where $a = 1, \dots, N(N-1)/2$ and T^a is a set of basis Hermitian matrices with normalization condition

$$\text{Tr}(T^a T^b) = 2\delta^{ab}. \quad (2.1)$$

Then, we consider

$$\begin{aligned} R'^{-1}R^{-1}R'R &= (1 + i\theta'^a T^a)(1 + i\theta^b T^b)(1 - i\theta'^c T^c)(1 - i\theta^d T^d) \\ &= 1 - 2\theta'^a \theta^b T^a T^b + 2\theta'^a \theta^b T^b T^a + \mathcal{O}(\theta^2). \end{aligned} \quad (2.2)$$

By the definition of group, the left-hand side is also an infinitesimal transformation

$$1 - i\theta''^c T^c = 1 - 2\theta'^a \theta^b T^a T^b + 2\theta'^a \theta^b T^b T^a + \mathcal{O}(\theta^2), \quad (2.3)$$

which gives

$$[T^a, T^b] = i \frac{\theta''^c}{\theta'^a \theta^b} T^c = if^{abc} T^c. \quad (2.4)$$

3. Noether Current and Charge Algebra, Q24.3

- Find the Noether current $j^{a\mu}$ for the transformation of eq. (24.6).
- Show that $[\phi_i, Q^a] = (T^a)_{ij}\phi_j$, where Q^a is the Noether charge.
- Use this result, eq. (24.7), and the Jacobi identity (see problem 2.8) to show that $[Q^a, Q^b] = if^{abc}Q^c$.

Solution. For scalar field theories that is invariant under $SO(N)$ ($\delta\mathcal{L} = 0$). The infinitesimal transformation is given by

$$\phi_i(x) \rightarrow \phi'_i(x) = \phi_i(x) - i\theta^a (T^a)_{ij} \phi_j(x). \quad (3.1)$$

Therefore, the Noether current is given by

$$j^\mu = \frac{\partial\mathcal{L}}{\partial(\partial_\mu\phi_i(x))} \delta\phi_i(x) = i\theta^a \partial^\mu\phi_i(x) (T^a)_{ij} \phi_j(x). \quad (3.2)$$

Getting rid of the parameter, we find

$$j^{a\mu} = i\partial^\mu\phi_i(x) (T^a)_{ij} \phi_j(x). \quad (3.3)$$

Then, we can defined the conserved charge

$$Q^a = \int_{\Sigma} d^{d-1}x j^{a0} = -i(T^a)_{ij} \int_{\Sigma} d^{d-1}x \pi_i(x) \phi_j(x). \quad (3.4)$$

Using the equal time commutation relation,

$$[\phi_i(\mathbf{x}, t), \pi_j(\mathbf{y}, t)] = i\delta_{ij}\delta^{d-1}(\mathbf{x} - \mathbf{y}), \quad [\phi_i(\mathbf{x}, t), \phi_j(\mathbf{y}, t)] = 0, \quad (3.5)$$

we find

$$[\phi_i(\mathbf{x}, t), Q^a] = (T^a)_{ij} \phi_j(\mathbf{x}, t), \quad (3.6)$$

where we have used the fact that Q_a is conserved, and therefore the same for any t . Similarly

$$[\pi_i(\mathbf{x}, t), Q^a] = -(T^a)_{ij} \pi_j(\mathbf{x}, t). \quad (3.7)$$

Then, we consider

$$\begin{aligned} [Q^a, Q^b] &= i(T^a)_{ij} \int_{\Sigma} d^{d-1}x [\pi_i(x) \phi_j(x), Q^b] \\ &= i(T^a)_{ij} \int_{\Sigma} d^{d-1}x (\pi_i(x) [\phi_j(x), Q^b] + [\pi_i(x), Q^b] \phi_j(x)) \\ &= i(T^a)_{ij} \int_{\Sigma} d^{d-1}x (\pi_i(x) (T^b)_{jk} \phi_k(x) - \pi_k (T^b)_{ki} \phi_j(x)) \\ &= i[T^a, T^b]_{ik} \int_{\Sigma} d^{d-1}x \pi_i(x) \phi_k(x) = if^{abc} Q^c. \end{aligned} \quad (3.8)$$

4. Generators of $Sp(2N)$, Q24.4

The elements of the group $SO(N)$ can be defined as $N \times N$ matrices R that satisfy

$$R_{ii'} R_{jj'} \delta_{i'j'} = \delta_{ij}. \quad (4.1)$$

The elements of the *symplectic group* $Sp(2N)$ can be defined as $2N \times 2N$ matrices S that satisfy

$$S_{ii'} S_{jj'} \eta_{i'j'} = \eta_{ij}, \quad (4.2)$$

where the *symplectic metric* η_{ij} is antisymmetric, $\eta_{ij} = -\eta_{ji}$, and squares to minus the identity: $\eta^2 = -I$. One way to write η is

$$\eta = \begin{pmatrix} 0 & I \\ -I & 0 \end{pmatrix}, \quad (4.3)$$

where I is the $N \times N$ identity matrix. Find the number of generators of $Sp(2N)$.

Solution. We shall write down an infinitesimal transformation of $Sp(2N)$,

$$S_{ij} = \delta_{ij} - i\theta^a (T^a)_{ij}, \quad (4.4)$$

so that

$$(\delta_{ij} - i\theta^a(T^a)_{ij})(\delta_{lk} - i\theta^a(T^a)_{lk})\eta_{jk} = \eta_{il} + i\theta^a(T^a)_{lk}\eta_{ik} + i\theta^a(T^a)_{ij}\eta_{jl} = \eta_{il}. \quad (4.5)$$

This implies that

$$(T^a)_{lj}\eta_{ij} + (T^a)_{ij}\eta_{jl} = 0, \quad (4.6)$$

which means that $T^a\eta$ must be symmetric. Therefore, there are $N(2N+1)$ independent components for $T^a\eta$, and hence for T^a .
